Making Back Translations
with Project Interlinearizer

There are many ways to produce a back translation of a vernacular translation text. By using ParaTExt's project Interlinearizer, teams can produce back translations faster and with formating that matches the vernacular text. Because the back translation produced by the interlinearizer exactly matches the form of the vernacular, it will scroll smoothly with vernacular while it is being evaluted. The following tutorial will show the steps necessary for producing a back translation using the project Interlinearizer.
